

ABSTRACT

Technology improvement especially in tourism sector is growing fast and there is a lot of data that need to be processed. The real example for this case is hotel booking system. Many hotel suppliers in Indonesia do their booking processes manually. As it is problem, this is difficult for customer to remember each of their web sites to do booking process via web. This system is an application that can be used for hotel booking system processes. With this system, hotel suppliers can sell their room as many as needed and customer is able to search a hotel in some city and compare it simultaneously. This system is developed using JSP programming language, JSTL, and mySQL database.

Keyword : hotel booking, online reservation, JSP, JSTL
