*Breast cancer is currently the world's second-leading cause of death after cervix cancer. Based on Pathological Based Registration, breast cancer in Indonesia has a relative incidence of 11.5%. Estimation for the incidence itself is to be at least 20.000 new cases per year, more than 50% already at the final stage. Early examination is vital for diagnosis, considering the rarity of symptoms in this cancer.*

*The purpose of the study is to determine the prevalence of breast cancer in Hasan Sadikin Hospital from January 2009 - December 2009, the characteristics of distribution are according to age group, gender, location, histopathological type and stage of breast cancer.*

*The research was done using descriptive survey based on retrospective study design of medical records of hospitalized patients with Breast Cancer in Hasan Sadikin Hospital between January 2009 - December 2009.*

*The results showed that in 2009, there were 275 cases of Breast Cancer with the highest prevalence age group 40-49 years old, in men 0.36% and 99.64% in women, mostly found on the left side breast (41,09%), particularly in the outer upper quadrant (30.18%), of the IDC<sub>M</sub> histopathology type (60,37%), and as much as 37,82% had entered stage IIIB.*

*Keywords: Breast cancer, prevalence*
