Dear Dr Dr. Wahyu Widowati,

Journal of Reports in Pharmaceutical Sciences has received your manuscript entitled "Antidiabetic Potential Yacon (Smallanthus sonchifolius (Poepp.) H.Rob.) Leaf Extract via Antioxidant Activities, Inhibition of ?-glucosidase, ?-amylase, G6Pase by In Vitro Assay" for consideration for publication. The reference number for this manuscript is "jrptps_3_21". Kindly quote this in future correspondences related to this manuscript.

The manuscript is being reviewed for possible publication with the understanding that it is being submitted to ONE journal at a time and has NOT been published, simultaneously submitted, or already accepted for publication elsewhere either as a whole or in a part.

Online submission of this article implies that the corresponding author has written consent from all the contributors to act as the corresponding author.

All contributors are requested to send the **Digital Copyright Agreement Consent** within 1 week. The status can be viewed in the 'Manuscript Information page' from your area. The decision about the manuscript will be conveyed only on receipt of the agreement on copyright form received from all contributors.

High-resolution images are required at the time of acceptance, you should be notified separately for the same if images uploaded by you are not of printable quality.

The Editors will review the submitted manuscript initially. If found suitable, it will follow a double-blinded peer review. We aim to finish this review process within a short time frame, at the end of which a decision on the suitability or otherwise of the manuscript will be conveyed to you via this system.

During this process, you are free to check the progress of the manuscript through various phases from our online manuscript processing site <u>https://review.jow.medknow.com/jrptps</u>.

We thank you for submitting your valuable work to the Journal of Reports in Pharmaceutical Sciences.

Yours sincerely,

Editorial Team

Journal of Reports in Pharmaceutical Sciences

Dear Dr Widowati,

With reference to your manuscript jrptps_3_21 entitled Antidiabetic Potential Yacon (Smallanthus sonchifolius (Poepp.) H.Rob.) Leaf Extract via Antioxidant Activities, Inhibition of ?-glucosidase, ?-amylase, G6Pase by In Vitro Assay, please review the comments of the referees from our site <u>https://review.jow.medknow.com/jrptps</u>. The manuscript would be reconsidered after requisite modifications as per the comments and instructions provided by the journal.

If you wish to continue with the publication process, kindly make the changes according to the comments and upload the revised manuscript along with clarifications for all the comments clearly indicating the areas where the changes have been made.

Do check the FAQ regarding replying to the comments and uploading a file. The template of point-by-point comments files for the reviewers, is available in your dashboard under the 'Downloads' menu option.

The journal allows two weeks for the revision of the manuscript. If we do not hear from you within this period, we will consider it as your decision to withdraw your article from publication. Please also note that the submission of the revised article does not guarantee its final acceptance by the journal.

We thank you for submitting your valuable research work to Journal of Reports in Pharmaceutical Sciences.

With warm personal regards,

Editorial Team

Journal of Reports in Pharmaceutical Sciences

Journal of Reports in Pharmaceutical Sciences <editor@jrpsjournal.com> Kepada:wahyu_w60@yahoo.com Sel, 13 Apr jam 11.52

Dr Wahyu Widowati,

Journal of Reports in Pharmaceutical Sciences has received your revised manuscript entitled '[ARTICLE_TITLE].' The manuscript will be re-evaluated by concerned referees for the final decision regarding its suitability for publication. We will get back to you within four weeks.

We thank you for submitting your valuable research work to Journal of Reports in Pharmaceutical Sciences.

With warm personal regards,

The Editorial Team

Journal of Reports in Pharmaceutical Sciences

The Editor

Sub: Submission of Manuscript for publication

Dear Sir,

We intend to publish an article entitled "Antidiabetic Potential Yacon (Smallanthus sonchifolius (Poepp.) H.Rob.) Leaf Extract via Antioxidant Activities, Inhibition of α-glucosidase, α-amylase, G6P by In Vitro Assay" in your esteemed journal as an Original Article.

On behalf of all the contributors I will act and guarantor and will correspond with the journal from this point onward.

This manuscript has not been published and is not under consideration for publication elsewhere. This study didn't use animal or human for the subject. Also it was supported by Aretha Medika Utama, Biomolecular and Biomedical Research Center, Bandung, Indonesia. All the authors have directly approved the final version manuscript. We also have no conflicts of interest.

We hereby transfer, assign, or otherwise convey all copyright ownership, including any and all rights incidental thereto, exclusively to the journal, in the event that such work is published by the journal.

We would like to suggest following referees for the article.

Thank you,

Sincerely,

Wala

Dr. Wahyu Widowati, M.Si.

Commented [D1]: Title of the manuscript

Checklist (to be tick marked, as applicable and one copy attached with the manuscript)

 Manuscript Title
 Antidiabetic Potential Yacon (Smallanthus sonchifolius (Poepp.) H.Rob.) Leaf Extract via Antioxidant Activities, Inhibition of α-glucosidase, α-amylase, G6P by In Vitro Assay

Checklist

Covering letter

- \blacksquare Signed by all contributors
- Previous publication / presentations mentioned
- Source of funding mentioned
- \square Conflicts of interest disclosed

Authors

- Middle name initials provided
- Author for correspondence, with e-mail address provided
- \square Number of contributors restricted as per the instructions
- ☑ Identity not revealed in paper except title page (e.g. name of the institute in material and methods, citing previous study as 'our study', names on figure labels, name of institute in photographs, etc.)

Presentation and format

- ☑ Double spacing
- \square Margins 2.5 cm from all four sides
- ☑ Title page contains all the desired information (vide supra)
- ☑ Running title provided (not more than 50 characters)
- \blacksquare Abstract page contains the full title of the manuscript
- Abstract provided (not more than 150 words for case reports and 250 words for original articles)
- ☑ Structured abstract provided for an original article
- \square Key words provided (three or more)
- ☑ Key messages provided
- ☑ Introduction of 75-100 words
- ☑ Headings in title case (not ALL CAPITALS, not underlined)
- \blacksquare References cited in superscript in the text without brackets
- \square References according to the journal's instructions.

Language and grammar

Uniformly British English

- ☑ Abbreviations spelt out in full for the first time
- \square Numerals from 1 to 10 spelt out
- \square Numerals at the beginning of the sentence spelt out

Tables and figures

- ☑ No repetition of data in tables/graphs and in text
- Actual numbers from which graphs drawn, provided
- Figures necessary and of good quality (colour)
- ☑ Table and figure numbers in Arabic letters (not Roman)
- \square Labels pasted on back of the photographs (no names written)
- ☑ Figure legends provided (not more than 40 words)
- ☑ Patients' privacy maintained (if not, written permission enclosed)

☑ Credit note for borrowed figures/tables provided Manuscript provided on a floppy with single spacing

Type of article: Original

Title Page

Title of the article: Antidiabetic Potential Yacon (Smallanthus sonchifolius (Poepp.) H.Rob.) Leaf Extract via Antioxidant Activities, Inhibition of α-glucosidase, α-amylase, G6P by In Vitro Assay

Running title: Anti-inflammatory Activity of Ginger

Title of the article: Antidiabetic Potential Yacon (*Smallanthus sonchifolius* (Poepp.) H.Rob.) Leaf Extract via Antioxidant Activities, Inhibition of α -glucosidase, α -amylase, G6Pase by *In Vitro* Assay

Abstract:

Background:

Diabetes is a chronic disease characterized by glucose levels and results in impaired insulin secretion. This disorder has triggered oxidative stress and excess free radicals condition. *Smallanthus sonchifolius*. a tradiotional medicine that acts as an diabetic therapy.

Aims:

This research aims to bring out the antidiabetic and antioxidant potential of of *Smallanthus. sonchifolius* extract (SSE).

Methods:

This study was conducted to measure the qualitative phytochemical identification, antioxidant and anti-diabetic activity of SSE. The antioxidant assay was carried out using 2,2-diphenyl-1-picrylhydrazine (DPPH)-scavenging activity, 2,2'-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid) (ABTS)-scavenging and hydro peroxide (H_2O_2) -

reducing activity assays, ferric reducing antioxidant power (FRAP) potency, while anti-diabetic activity of SSE assay was carried out using inhibitory of α -amylase, α -glucosidase, and Glucose-6-Phosphatase (G-6-Pase).

Results:

SSE contained phenols, flavonoids, terpenoids, saponins, tannins and alkaloids. The antioxidant and antidiabetic activities of samples were calculated based on median inhibitory concentration (IC₅₀). The IC₅₀ value of SSE antioxidant respectively were DPPH (IC₅₀=62.72 μ g/mL), ABTS (IC₅₀=61.03 μ g/mL), H₂O₂ (IC₅₀=438.36 μ g/mL), the highest FRAP activity was 125.31 μ M Fe(II)/ μ g extract at concentration level of SSE 50 μ g/mL. The IC₅₀ value of SSE antidiabetic were α -amylase inhibition (IC₅₀=37.86 μ g/mL), α -glucosidase inhibition (IC₅₀=90.41 μ g/mL), and G-6-Pase inhibition (IC₅₀=98.07 μ g/mL), respectively.

Conclusions:

SSE has antidiabetic potential through antioxidant activities and α -glucosidase, α -amylase and G-6-Pase inhibition activities.

Key-words:

Antioxidant, S. sonchifolius, diabetes, a-glucosidase, a-amylase

Text

Introduction:

Diabetes mellitus (DM) occured when glucose levels in the blood are high because the insulin produced is not sufficient for the body's needs. This is can be divided into three groups. In people with type 1 diabetes, pancreatic β cells produce less insulin. The most common condition is type 2, about 90-95% of all diabetic cases. Fat, muscles, and liver cells that undergo insulin insensitivity is one symptom of this disease.^[11] The ability of the pancreas to produce insulin in response to food intake that has gradually decreased. Apart from that, pregnancy insulin insufficiency also causes high glucose levels in the blood. This is known as gestational diabetes.^[2]

Insulin resistance caused dysfunction in β cells. Because the primary function of β -cells is to store and secrete insulin in response to glucose load, this dysfunction trigger β -cells lose the ability to adequately sense blood glucose concentration or to release sufficient insulin in response. Hence, this dysfunction leads to a condition named hyperglycemia. ^[3] Hyperglycemia could increase Reactive Oxygen Species (ROS) resulting in oxidative stress. Oxidative stress will result in various oxidative damage in the form of DM complications and could worsen the condition of DM patient, therefore it is necessary to normalize ROS levels to prevent oxidative stress. ^[4]

One way to overcome DM is to inhibit the enzymes action that hydrolyze carbohydrates, glucose absorption could be reduced. Enzymes play an important role in breaking down oligosaccharides and disaccharides into monosaccharides are α -amylase and α -glucosidase enzymes result absorpted ready subtances. ^[5,6]

The α -glucosidase found in the mucosal bulk of the small intestine is a biocatalyst for the digestion of starch and disaccharides. The α -glucosidase works by inhibiting carbohydrates and reducing postprandial blood glucose excretion. With this mechanism, glycosidase plays an important role in polysaccharide metabolism, glycoprotein processing, cellular interactions and expanding prospects for creating new diabetes treatment, viral infections, obesity to metastatic cancer. The α -glucosidase functions selectively in hydrolyzing the terminal (1 \rightarrow 4 residues) of α -glucose (starch or disaccharide) to produce a single α -glucose molecule. Thus, the various types of α -glucosidase inhibitors have been extensively developed. The enzyme inhibitors such as voglibose miglitol, acarbose have ability to reduce postprandial blood glucose by interfering with the carbohydrate-digesting enzymes and delaying glucose absorption.^[7] Inhibition of α -glucosidase and α -amylase enzymes can significantly decrease the postprandial glucose level after consuming carbohydrate diet and therefore can be used as important strategy in the management of postprandial blood glucose level in type 2 diabetic patients.^[8]

Glucose-6-Phosphatase, (G-6-Pase), the central hepatic gluconeogenic enzyme, in glucose homeostasis and type 2 diabetic patients, this enzyme activity is higher in diabetic animals, humans and therefore could be an important key player in the elevated glucose production.^[9]

The synthetic drugs have unpredictable and more severe side effects, so needed to improve safer, more effective the anti-diabetes mellitus potential compounds. $^{[10]}$

It is known that there are some plants are considered anti-diabetes. This is proven and is expected to be a promising opportunity in the future.^[11] Various species of herbs drugs like cinnamon, ginger, aloe vera, okra, and yacon have been described in scientific and popular literature as having antidiabetic activity. However, further studies on effectiveness, protection is needed for particular conflicts in herbal extracts. Therefore, in this study yacon leaf will be the main observed. The main compounds responsible for targeting health benefits are phenolic, terpenoids, flavonoids, and coumarins. At times, the reported clinical behavior was also linked to a group of

phytochemicals exhibiting synergy. Hence, the combination of phytochemicals contained in an herbal antidiabetic is thought to be useful also for many metabolic pathways.^[12] Searching for novel and new herbal medicine which have anti-diabetic and antioxidant properties are considerable attention in recently decades.^[7]

This study investigates the bioactive compounds in *Smallanthus sonchifolius* for DM therapy and potential mechanisms of antioxidant activity including free radical scavenging activity of 2,2-diphenyl-1-picrylhydrazine (DPPH), 2,2'-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid) (ABTS), hydro peroxide (H₂O₂) and potential of ferric reducing antioxidant power (FRAP), anti-diabetic activities namely α -glucosidase, α -amylase, and G6Pase inhibitory activity assay.

Subjects and Methods:

Preparation of S. sonchifolius extract

Yacon plant were obtained from Cibodas, Lembang, Bandung west Java, Indonesia and decided by herbarium staff Mr. Djuandi Biology Department, School of Life Science and Technology, Bandung Institute of Technology resulted name *Smallanthus sonchifolius* (Poepp.) H.Rob. or *Polymnia edulis* Wedd.

The extraction was performed in the form of a maceration. $^{[13],[14],[15][16]}$ Dried *S. sonchifolius* leaves were soaked in 70% distilled ethanol. Filtration was taken every 24 hours, the process was performed until the colorless filtrate was found. The filtrate was then evaporated with a rotatory evaporator to obtain SSE, and then was stored at -20°C. $^{[13],[14],[15]'[16]}$

Phytochemical Screening

The modified fransworth method is the basis for the SSE test because it can recognize phytochemical compounds such as phenols, saponins, steroids/terpenoids, tannins, flavonoids, and alkaloids. ^{[13],[14],[15][16]}

Phenol Identification

SSE as much as 10 mg was loaded on a drop plate and mixed with 1% FeCl₃ (Merck 1.03861.0250). Good results for the phenol test is green, red, purple, blue, and black. $^{[13],[14],[15],[16]}$

Saponin Identification

A little water was added to the test tube which already contains 10 mg of SSE previously and boiled for 5 minutes. The foamy surface after shaking showed saponins. ^{[13],[14],[15],[16]}

Steroid Identification

A drop plate containing 10 mg of SSE was added with acetic acid until coated. Then mix with 1 drop of sulfuric acid (H_2SO_4) (Merck 109073) after 10-15 minutes. Positive results for the triterpenoid countermeasures in red and orange but green and blue for steroids. ^{[13],[14],[15],[16]}

Terpenoid Identification

Initially SSE was added to the dropping plate. Then vanillin and H_2SO_4 was added. The presence of terpenoid was suggested on the mixture by the purple color. $^{[13],[14],[15],[16]}$

Tanin Identification

In a test tube SSE as much as 10 mg and 2N HCl (Merck 1003171000) as much as 2 mL were mixed. Then the mixture was put in a water bath and cooled for 30 minutes. Further filtration was carried out with amyl alcohol (Merck 10979). The purple colour that formed was indicator of the tannins presence in sample. $^{[13],[14],[15],[16]}$

Flavonoid Identification

About 10 mg SSE, Mg (Merck EM105815) and 2N HCl were added to the test tube. The test tube was heated for for 5 to 10 minutes, then filtered after cooling with the addition of amyl alcohol. A positive reaction is determined by red or orange color. ^{[13],[14],[15],[16]}

Alkaloid Identification

The test tube had 10 mg of SSE added, accompanied by 10% ammonia. Two layers of liquid were formed after chloroform was applied to the mixture, and precipitate was form at the bottom layer. HCl 1N was applied to the solution and two layers were formed. A shift in yellow color suggested that the sample contains alkaloids. [13],[14],[15],[16]

DPPH Scavenging Activity Assay

SSE with different concentration was added 50 μ L in each well at 96-well microplate. Then, 2,2-Diphenyl-1picrylhydrazil (DPPH) (Sigma Aldrich D9132) (0,077 mmol/L in methanol) as much as 200 μ l was inserted. The samples were incubated at room temperature for 30 min in the darkroom. The microplate reader (MultiskanTM GO Microplate Spectrophotometer, Thermo Scientific) translates the absorbance value at a wavelength of 517 nm. The following formula describes the calculation of the radical scavenging: ^{[4],[13],[14],[15],[16],[17]}

% Scavenging = $(Ac - As) / Ac \ge 100$

Ac = negative control absorbance (without sample).

As = sample absorbance.

FRAP Scavenging Activity Assay

Preparation of the FRAP reagent was carried out by combining 2,4,6-Tris(2-pyridyl)-s-triazine (TPTZ) (10 mM, Sigma Aldrich 368235-7) in HCl 40 mM and 300 mM acetate buffer (1 mL and 10 mL, respectively). Next, 7.5 μ L of different SSE concentration were combined with FRAP reagent as much as 142.5 μ L in 96-well microplate and then incubated at 37°C for 30 min. The absorbance value was determined at 593 nm. The standard curve was rendered using FeSO4, ranging from 0.019 to 95 μ g/mL FeSO4. Sample findings were expressed in SSE of μ M Fe(II)/ μ g. ^{[4], [13], [14], [15], [14], [15], [16]}

H2O2 Scavenging Activity Assay

In each well, 60 μ L of different concentration of SSE, ferrous ammonium sulfate 12 μ L, 1 mM (Merck, 1.03792.1000), and H₂O₂ 5 mM (3 μ L) (Merck 1.08597.1000) were added. After that, the mixture was incubated in darkroom for 5 minutes. The 1,10 Phenanthroline (Sigma Aldrich 131377) as much as 75 μ L was put into the well. Then the mixture was incubated again for 10 minutes at room temperature. Measurement of the scavenging activity absorbance at a wavelength of 510 nm.^{[15],[16],[18]} The formula used to measure H₂O₂ scavenging activity is :

% Scavenging = $(Ac - As) / Ac \times 100$

Ac = negative control absorbance (without sample).

As = sample absorbance.

ABTS Scavenging Activity Assay

The antioxidant activity of SSE was measured with 2,2'-Azinobis-(3-ethylbenzothiazoline-6-sulfonic acid) (ABTS⁺⁺) (Sigma Aldrich A1888). ABTS⁺⁺ was obtained by mixing 14 mM ABTS and 4.9 mM potassium persulfate (Merck EM105091) in a volume ratio of 1:1 for 16 hours at room temperature in the dark condition. The mixture was dissolved with 5.5 mM Phosphate Buffer Saline (PBS) (pH 7.4) until the solution absorbance at a wavelength of 745 nm was 0.70 \pm 0.02. In short, 2 µL of varying SSE concentration (1.56-50 µg/mL) were added to each well at 96-well microplate. Then 198 µL of ABTS⁺⁺ solution was added to the samples. The plates were incubated at 30°C for 6 minutes and then the absorption was measured at 745 nm. The percentage of ABTS radical resistance (percentage) was determined by the ratio of ABTS⁺⁺ between the decrease in absorbance in the presence of a sample compared to the absorbance without the sample.^{[4],[13],[14],[15],16],[19]} The formula used to measure ABTS scavenging activity is

% Scavenging = $(Ac - As) / Ac \times 100$

Ac = negative control absorbance (without sample).

As = sample absorbance

a-amylase Inhibitory Activity Assay

A updated procedure was used to conduct the α -amylase inhibitory activity assay. The SSE with various concentration was put into the sample well, with dimethyl sulfoxide (DMSO) was used as a blank. Furthermore, the α -amylase enzyme (Sigma Aldrich A7595) was added into each well, except for blank well. Then the mixture was incubated at 37°C for 10 minutes. After that a starch solution was added in each well, while control well was added with phosphate buffer. Another incubation for 15 minutes at 37°C was conducted. The addition of the acid iodine solution will stop the enzymatic reaction. The absorbance was observed at a wavelength of 565 nm.^{[14],[20],[21]} Here is a formula that defines the percentage of α -amylase inhibition:

% Inhibition = $(Ac - As) / Ac \ge 100$

Ac = negative control absorbance (without sample).

As = sample absorbance.

a-glucosidase Inhibitory Activity Assay

Various concentration of SSE was mixed with 4-Nitrophenyl α-D-glucopyranoside (Sigma Aldrich N1377) and phosphate buffer (pH 7.0) in 96-well microplate. After mixed well, α-glucosidase from *Saccharomyces cerevisiae* (Sigma Aldrich G5003-100UN) was added, then incubated at 37°C for 30 minutes. After that Na₂CO₃ (Merck

1.06392.0500) was added. The absorbance was measured at 400 nm wavelength.^{[14],[20]} Here is an equation for the percentage of α -glucosidase inhibition:

% Inhibition = $(Ac - As) / Ac \ge 100$

Ac = negative control absorbance (without sample).

As = sample absorbance.

G-6-Pase Inhibitory Activity Assay

G-6-Pase from rabbit liver (Sigma Aldrich G5758-25UN) 0.09 U/mg was added 10 μ L, along with 40 μ L sodium acetate buffer solution (Sigma Aldrich S7899), and 10 μ L of various level of SSE (5.51-176.47 μ g/mL). The well plate was incubated for 20 mins at 37°C. Then, 20 μ L glucose-6-phosphate disodium salt hydrate (Sigma Aldrich G7250) in sodium acetate buffer solution was added and incubated for 15 mins at 37°C. Then, 1% ammonium molybdate tetrahydrate (Sigma Aldrich G8681) was added with 1% metol (Sigma Aldrich 69749) in 3% sodium bisulfite (Sigma Aldrich F2246). The blue color will appear positive and the absorbance is measured at 660 nm.^[9] With this equation the inhibitory activity of glucose-6-phosphatase was represented as a percentage :

```
% Inhibition = (Ac - As) / Ac \ge 100
```

Ac = negative control absorbance (without sample).

As = sample absorbance.

Results:

Phytochemical Screening of SSE

The screening result showed the presence of phenols, flavonoids, tannins, alkaloids, saponins, and terpenoids in SSE. The phytochemical screening results for SSE could be seen in Table 1. In Table 1, it is known that the SSE phytochemical assay of flavonoids, saponins, phenols, tannins, steroids, triterpenoids, and alkaloids shows positive results.

Antioxidant Activity of SSE

The percentage of DPPH scavenging activity of SSE could be seen in Figure 1a. Free radical scavenger, resulting decolorization and the decreasing absorbance value. In this research, SSE has DPPH scavenging activity with IC_{50} =62,72 µg/mL (Table 2), it was categorized active antioxidant which have IC_{50} value 50-100 µg/mL.^[17]

FRAP activity of SSE could be seen in Figure 1b. The outcome of this study showed concentration-dependent activity of FRAP, in which higher concentrations increased activity of FRAP. The highest FRAP activity was 125.31 μ M Fe(II)/ μ g extract at concentration level of SSE 50 μ g/mL.

Hydrogen peroxide acts as both an oxidizer and a direct function, usually by oxidizing the essential thiol group (-SH). From Figure 1c, it could be observed that H_2O_2 scavenging activity is influenced by SSE concentration. In Table 2, it could be seen that SSE has low H_2O_2 scavenging activity with IC_{50} =438.36 µg/mL, it was categorized weak antioxidant activity with IC_{50} value 200-500 µg/mL. ^[17]

Calculation of the reduction of blue-green radical ABTS solution with hydrogen-donating antioxidants using long wave spectrum absorption. The result ABTS-reducing activity of SSE could be seen in Figure 1d. As shown in Table 2, the value ABTS scavenging activity of SSE with IC_{50} =61.03 µg/mL, it was categorized active antioxidant with IC_{50} value 50-100 µg/mL.^[17]

Anti-diabetic activity assay

The activity of α -amylase inhibition showed concentration-dependent activity, in which increased concentrations produced higher inhibitory activity (Figure 2a). Inhibitory activity of α -amylase with IC₅₀ = 37.86 µg/mL, it was the most active compared to α -glucosidase inhibition, G6-Pase inhibition activities (Table 3). SSE had highly active α -amylase inhibition with IC50 value < 50 µg/mL.^[17]

As shown in Figure 2b, SSE had significant α -glucosidase inhibition activity differences at each concentration, with higher concentration increased the α -glucosidase inhibition activity. Inhibition of α -glucosidase. In Table 3, SSE had α -glucosidase inhibition properties with IC₅₀ value was 90.41 µg/mL, it was categorized active α -glucosidase inhibition activity. ^[17]

G-6-Pase as a carbohydrate hydrolyzing enzyme is closely related to DM. The G-6-Pase inhibitory of SSE could be seen in Figure 2c, with higher concentration increased the G-6-Pase inhibition activity. In Table 3, SSE also showed G-6-Pase inhibitory properties with IC₅₀ 98.07 μ g/mL, it was categorized active G-6-Pase inhibition activity.^[17]

Discussion:

Yacon leaves extract consist of various chemical compounds.^[2] This result was in line with previous study that tuberous roots, leaves and rhizome of *S. sonchifolius* from various genotypes (New Zealand, Ecuador, Bolivia, Germany) contained various total phenol 34.94-68.49 mg/g.^[23] SSE also contained flavonoids, and this result data was validated with previous research that total flavonoid content in peel, flesh, whole yacon tubers has been significantly affected by cultivar and tuber part.^[24] Butanol extract on yacon leaves showed the presence of three dicaffeoilquinic, caffeic, and chlorogenic acids.^{[2],[25]} Previous research also stated that the presence of chlorogenic acid, gallic acid, ferulic acid, and caffeic as phenolic compounds from the hydroethanolic extract in yacon.^[26] Five races of *S. sonchifolius* were tested, the ethanol extract and the decoction extract were proven to produce a higher number of flavonoids, like luteolin 7-O-glucoside and luteolin 3',7O-diglucoside together with luteolin and apigenin.^{[2],[27]} Yacon extract with various solvent contained tannins 6.38-14.58 mg tannic acid equivalent/g (mg TAE/g).^[28]

One of the reagents that could be used in the compound free radical scavenging activity test was DPPH. The final outcome of the solution is yellow because of SSE could reduce stable DPPH radicals to diphenylpicrylhydrazine (DPPH-H).^{[4],[13],[14]} Based on Figure 1a, DPPH was a concentration-dependent operation in which higher concentrations increased DPPH scavenging activity. In the study, the DPPH scavenging activity of SSE was in the range of 50-100 μ g/mL, indicating that it was classified as an active antioxidant.^{[17],[29]} This result was approved with a previous study that DPPH had radical scavenging activity in some parts of yacon including whole tuber, peel, flesh from a variety of cultivar.^[24] This result data was also supported by previous research that yacon compounds, namely caffeic acid and chlorogenic acid had DPPH scavenging activity with IC₅₀ value 0.86; 2.56 μ g/mL.^[30] *S. sonchifolius* (yacon) landraces with n-hexane, chloroform, chloroform/methanol and methanol resulted IC₅₀ value of DPPH scavenging activity 2.08-4.39 μ g/mL.^[28]

FRAP method is based on the reduction by antioxidants in acidic media of a ferroin analog, the Fe_3^+ complex of tripyridyltriazine Fe (TPTZ)₃⁺ to the deeply blue color Fe_2^+ complex Fe (TPTZ)₂⁺. Absorption of Fe(II) complex at 593 nm by antioxidant reduction of the corresponding tripyridyltriazine Fe(III) complex.^{[4],[13],[14],[27]} This data result was in line with previous research that hot-water extract of yacon herbal tea had FRAP activity of 21.8-46.1 µg TE/mL according time range and temperature range.^[31] Yacon extract using various solvent for extraction had FRAP activity with range of 31.55-66.80 mg TE/g.^[27]

 $\rm H_2O_2$ serves as an oxidizer, although $\rm H_2O_2$ could protect the cells membranes, it could be toxic inside the membranes. This was thought to derive from the hydroxyl radicals (OH*) formed when $\rm H_2O_2$ was found with Fe²⁺ or Cu²⁺. The value H_2O_2 scavenging activity of SSE categorized as weak with IC₅₀ value in the range of 250-500 $\mu g/m L.^{[17],[28],[29]}$ Based on the previous research, it has not been conducted yet for H_2O_2 scavenging activity. Previous study stated that hot-water extract on yacon herbal tea exhibited have antioxidant activity namely superoxide dismutase activity (SOD) 512-1,400 μg TE/mL according to time range and temperature range.^[30] Yacon extract with various solvent had SOD activity with IC₅₀ value 0.81-3.81 mg/mL.^[27] SOD is enzymatic antioxidant convert catalytically anion superoxide (O2*) to H_2O_2 free radical which H_2O_2 will produce OH* free radical.^[32]

ABTS-reducing behavior monitoring calculates the antioxidant relative capacity to scavenged the ABTS it created. Strong oxidizers such as the ABTS salt (potassium permanganate /potassium persulfate) when reacting could produce ABTS. Based on Figure 1d, the scavenging activity of ABTS was directly proportional to the concentration. When the concentration was high, the scavenging activity of ABTS increases. ABTS scavenging activity of SSE categorized as an active antioxidant with IC_{50} value 50-100 µg/mL^{[17],[29]}. This data was inline with previous research that various part of yacon (pulp flour of yacon, peel flour of yacon, yacon pulp, yacon peel) had ABTS value in range of 10.38-8,456.2 µmol TE/g^[33]

The α -glucosidase activity of SSE occurred in a concentration-dependent manner in which higher α -glucosidase inhibition present in a higher concentration of the sample. Inhibition of SSE to α -glucosidase was in the range of IC₅₀=50-100 µg/mL, indicating that it was classified as an active antioxidant ^{[17],[29]}. This inhibition was caused by smaditerpenic acid-type compounds that reported could inhibit α -glucosidase strongly and similar to acarbose.^[34] Yacon extract using various solvent had α -glucosidase inhibition activity with IC₅₀ in range of 1.00-6.50 mg/mL.^[28] The IC₅₀ activity of α -glucosidase smallanthaditerpenic acids A (1.43 µM), smallanthaditerpenic acids B (1.76 µM), smallanthaditerpenic acids C (1.86 µM), smallanthaditerpenic acid D (1.86 µM).^[35]

The α -amylase functions as a catalyst at the beginning of starch hydrolysis and were present in the digestive system. If the enzyme was inhibited, the breakdown of starch and oligosaccharides will be retained, so that postprandial blood glucose levels will decrease.^{[14],[20]} Inhibition activity of SSE toward α -amylase was categorized as highly active when the IC₅₀ value was <50 µg/mL.^{[17],[29]} This result was supported with previous data that α -amylase inhibition activity of yacon extract using various solvent had IC₅₀ <1-<2 mg/mL.^[27]

Hyperglycemic and hyperglucose could be overcome by inhibiting G-6-Pase as enzyme hydrolysis using a therapeutic approach. Inhibitory properties of SSE to G-6-Pase categorized as active when the IC_{50} value was 50-100 µg/mL^{[17],[29]}. Supplementation of fermented yacon leaves tea water extract decrease G-6-Pase in the DM mice model. Low dose yacon decreased G-6-Pase to 70.39 nmol/min/mg protein and high dose yacon decreased G-6-Pase to 56.79 nmol/min/mg protein compared to G-6-Pase in DM mice 80.58 nmol/min/mg protein^{[36].}

Polyphenols are closely linked to radical scavenging activities free of DPPH, ABTS, H₂O₂, FRAP, which means that these substances have the potential to act as antioxidants and anti-diabetic mellitus. Leaves produce large quantities of phenolic compounds (ferrulic acids, chlorogenic, caffeic), flavonoids, and sesquiterpene lactone (SLs), as a source of biofunctional compounds^[37]. The following pathway could be proposed based on the potential of yacon leaves as an antidiabetic agent (Figure 3.).

Conclusions:

SSE has antidiabetic potential through antioxidant activities and α -glucosidase, α -amylase and G-6-Pase inhibition activities. It is important to continue this research on DM animal model for proving antioxidant and anti-diabetic activities of SSE.

Reviewer Response: Antidiabetic Potential Yacon (*Smallanthus sonchifolius* (Poepp.) H.Rob.) Leaf Extract via Antioxidant Activities, Inhibition of α -glucosidase, α -amylase, G6Pase by *In Vitro* Assay

- 1. Authors should provide specific and completely related references for introduction section Thank you for your correction. I've revised the introduction.
- Some statements must be corrected, for example: "The antioxidant assay using.." in page 1, "Measured with 2,2'-Azinobis..." in page 8, "Briefly 10 μL of G6Pase.." in page 9 and so on. Thank you for your correction. I have revised the sentences you mentioned, along with other sentences that need to be corrected.
- The abbreviation must be explained the first time it appears in the manuscript and in the following only abbreviation should be applied in the whole of manuscript, such as: LDL/PBS/DM/G6Pase/FRAP and so on Thank you for your correction, I've revised it.
- 4. Please check the text and consider the consistency of the words such as: phosphate buffer/PO43-buffer.
 - Thank you for your correction, I've revised it.
- Please add conclusion section in the text Thank you for your correction, I've added the conclusion.

(AQ2) 1	right	3	39-47	One way to overcome DM is to inhibit the enzymes action that hydrolyze carbohydrates, glucose absorption could be reduced. Enzymes play an important role in breaking down oligosaccharides and disaccharides into monosaccharides are α -amylase and α -glucosidase enzymes result absorpted ready subtances.[5]	There are several ways to overcome DM, one of which is by inhibiting enzymes that work to hydrolyze carbohydrates. Inhibition of these enzymes causes reduced glucose absorption. The α -amylase and α -glucosidase are enzymes that help break down oligosaccharides and disaccharides into easily absorbed monosaccharides.
(AQ3) 2	Left and right	5	54	Yacon plant was obtained from Cibodas, Lembang, Bandung west Java, Indonesia and decided by herbarium staff Mr. Djuandi, Biology Department, School of Life Science and Technology, Bandung Institute of Technology resulted name <i>Smallanthus</i> <i>sonchifolius</i> (Poepp.) H.Rob. or <i>Polymnia</i> <i>edulis</i> Wedd.	Yacon plant was obtained from Cibodas, Lembang, Bandung, West Java, Indonesia. The plant was botanical characterized by herbarium staff of Bandung Institute of Bandung Institute of Technology. The scientific name of the plant was <i>Smallanthus</i> <i>sonchifolius</i> (Poepp.) H.Rob. or <i>Polymnia</i> <i>edulis</i> Wedd.
