#### Fakultas Kedokteran Gigi

#### SURAT TUGAS No. 630/FKG-UKM/IX/2023

Yang bertanda tangan di bawah ini

Nama

: Dr. Ignatius Setiawan, drg., MM.

Jabatan

: Dekan Fakultas Kedokteran Gigi Universitas Kristen Maranatha

#### Dengan ini menugaskan kepada:

No	Nama Dosen	NIK
1.	Dr. Vinna Kurniawati Sugiaman, drg., M.Kes.,PBO., CMC.	120005
2.	Silvia Naliani, drg., Sp.Pros., M.K.G., CMC.	120029
3.	Rosalina Intan Saputri, drg., DDS., M.Sc.	120054
4.	Jane Amelia Vebriani Wibisono, drg., Sp.Pros.	120056

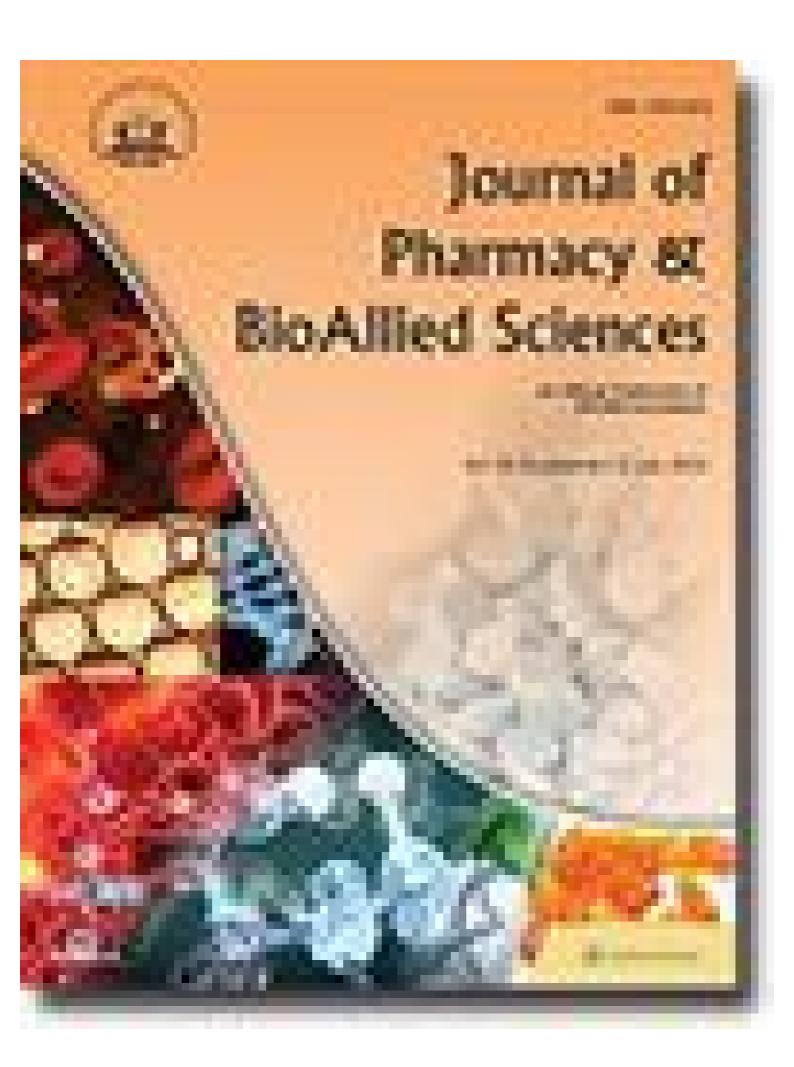

Melaksanakan publikasi Jurnal: Characterization of Lemongrass Extract (Cymbopagon Citratus)
Nanoemulsion and Its Application as Antibiofilm Agent for Acrylic Resin di Journal Pharmacy
& BioAllied Science pada Bulan Agustus 2023.

Demikian agar tugas ini dilaksanakan dengan sebaik-baiknya.

Bandung, 01 September 2023 Dekan Fakultas Kedokteran Gigi Universitas Kristen Maranatha

Dr. Ignatius Setiawan, drg., MM..

NIK. 120010

Submitted: 09-Apr-2024 Revised: 11-Apr-2024 Accepted: 17-Apr-2024 Published: 31-Jul-2024 **Background:** An antimicrobial agent is needed for denture cleaning, such as lemongrass (LG), which has a bioactive antimicrobial component. **Methods:** This research analyzed LG extract nanoparticles with a particle size analyzer, ZPA, and biofilm formation inhibition on resin acrylic surfaces. **Results:** We found that there is high stability in nanoparticle size, while other concentrations, including chlorhexidine as a positive control, did not show any statistical differences. **Conclusion:** Lemongrass oil nanoemulsion has proved to be an antibiofilm and effective as a denture cleaning agent because of its ability to inhibit Streptococcus mutans and Candida albicans growth.

**KEYWORDS:** Acrylic resin, antibiofilm, Candida albicans, Cymbopogon citratus, nanoemulsion, Streptococcus mutans

#### Introduction

 $m{P}^{ ext{oor}}$  oral hygiene is the most significant risk factor, which promotes bacterial colonization and adhesion in the denture base and oral cavity to form

biofilm.<sup>[1]</sup> Thicker and more complex biofilm organization will contribute to more severe conditions.<sup>[2]</sup> *Candida albicans* and *Streptococcus mutans* are the commonest fungi and bacteria related to this condition.<sup>[3]</sup> Thus, we aim to fabricate lemongrass oil nanoemulsion and test its potential against *S. mutans* and *C. albicans* as opportunistic microbes commonly found in denture stomatitis.

#### MATERIALS AND METHODS

Five ml of lemongrass oil was mixed and stirred with 5 ml propylene glycol, 5 ml PEG 400, and 10 ml glycerin with 5 ml of chromophore. Particle size was measured at HeNe 4 mW and 633 nm wavelength laser source between 0.6 nm and 9000 nm. A particle size analyzer (PSA) at 25°C temperature was used. Further, lemongrass oil nanoemulsion (LON) was prepared (30 mm of 100% LON stock was serially diluted in 10% DMSO to following concentrations: 100%, 50%, 25%, 12.5%, 6.25%, and 3.125%) and then sterilized using a 0.22  $\mu m$  pore syringe filter. S. mutans (ATCC-25175) and C. albicans (ATCC-10231) were cultured in Mueller Hinton Broth media for 24 hours at 37°C.

#### RESULTS

Zeta potential values of 3 LON samples are adequate with the following results: -48.6 mV, -49.2 mV, and -47.4 mV [Figure 1].

The highest percentage value of LON inhibition against *S.mutans* and *C. albicans* biofilm was  $95.59 \pm 0.54\%$  at 100% concentration. This value was nearly at the same rate as the inhibition value of chlorhexidine 0.2%, which was at  $99.61 \pm 0.01\%$  [Table 1 and Figure 2].

#### **DISCUSSION**

A previous study showed that several essential oil constituents from lemongrass have activity as antimicrobials, including monoterpene (C10H16),

diterpene (C20H32), sesquiterpene (C15H24), triterpene (C30H40), p-cymene, menthol, limonene, eugenol, anethole, geraniol, estragole, thymol, γ-terpinene, and cinnamyl alcohol. [4.5] Interaction between *S. mutans* and *C. albicans* can induce severe infection, which is challenging to treat. This interaction also increases the adhesion between species in biofilm and can cause microbial resistance. [6.7] Previous studies showed that bacterial biofilm could be inhibited or removed effectively by the active biology component of herbal plants. [8]

p-Cymene [1-methyl-4-(1-methyl ethyl)-benzene], one of the active constituents in LON, is a combination of mechanical and chemical denture cleaning often failed to remove *C. albicans* from denture biofilm.<sup>[9]</sup> One of the reasons is extracellular matrix material, which prevented penetration of cleaning agents into deep layer organisms.<sup>[10]</sup>

#### Conclusion

LON has proved to be an antibiofilm and effective as a denture cleaning agent because of its ability to inhibit Streptococcus mutans and Candida albicans growth.
