

## ***Abstrak***

*Penelitian ini dilakukan untuk mengetahui derajat self-compassion pada perawat Rumah Sakit “X” Bandung. Self-compassion memfokuskan pada derajat individu mendemonstrasikan self-kindness, common humanity, dan mindfulness (Neff, 2003). Metode penelitian yang digunakan adalah studi deskriptif dengan teknik survey pada seluruh perawat Rumah Sakit “X” Bandung sebanyak 118 orang. Alat ukur Self-compassion scale dari Neff (2003), terdiri dari 26 item, dan telah divalidasi menggunakan rumus Pearson oleh Missiliana pada 726 responden dengan validitas berkisar antara 0.323-0.606 dan reabilitas alat ukur dengan Alpha Cronbach adalah 0.818. Peneliti juga menguji validitas dengan rumus Pearson pada 118 responden berkisar antara 0.335-0.665 dan reabilitas alat ukur dengan Alpha Cronbach adalah 0.858. Berdasarkan penelitian sebanyak 69,5% perawat memiliki self-compassion rendah dan 30,5% perawat memiliki self-compassion tinggi. Hal ini menunjukkan bahwa perawat Rumah Sakit “X” masih menilai, menghakimi diri, mengkritik diri sendiri secara berlebihan berkaitan dengan kegagalan yang dialaminya dalam memberikan tindakan keperawatan (self-judgement). Perawat Rumah Sakit “X” berpandangan subjektif bahwa kegagalan tersebut hanya dialami oleh diri sendiri (isolation). Hal ini mengakibatkan perawat Rumah Sakit “X” berfokus pada kekurangannya yang menyebabkan terjadinya kegagalan, merasa diri lemah dan tidak berharga (overidentification). Saran peneliti adalah menambahkan data demografis sebagai data penunjang, mencari jumlah sampel yang seimbang, menambahkan pertanyaan open question mengenai orang terdekat subjek berkaitan dengan role of parents, melakukan group counseling dan couching and counseling bagi para perawat guna meningkatkan self-compassion yang dimiliki.*

**Kata kunci :** *self-compassion, self-kindness, common humanity, mindfulness, perawat.*

## **Abstract**

*This research was conducted to determine the self-compassion degree of "X" Hospital nurses in Bandung. Self-compassion focuses on the individual demonstrating the degree of self-kindness, common humanity, and mindfulness (Neff, 2003). The method in this research is descriptive with a survey technique to all nurses from that hospital which consists of 118 people. Self-compassion scale by Neff (2003) which consist of 26 items and based on the Pearson colleration, has been validated by Missiliana through 726 respondents, and showing the validation in between 0.323-0.606, and the reability based on Alpha Cronbach was 0.818. The researcher also tried out the validity of the Pearson formula to those 118 respondents was in between 0.335-0.665, while reability using the Alpha Cronbach, was 0.858. Based on the results of data processing, it is known that 69.5% respondents have low self-compassion degree, while the rest 30.5%, showing high self-compassion degree. This suggests that nurses Hospital "X" still judging yourself, excessive self-criticism related to the failure experienced in providing nursing actions (self-judgement). They have subjective view that failure is only experienced by yourself (isolation). This resulted in nurses Hospital "X" focusing on the shortcomings that caused the failure, feels himself weak and worthless (overidentification). The concerned researcher suggests to add demographic data as supporting data, looking for a balanced number of samples, adding open question relates about the closest person with subject of the role of parents, do group counseling and couching and counseling for nurses to increase their self-compassion.*

**Keywords :** self-compassion, self-kindness, common humanity, mindfulness, nurse.
